Cartesian **geometry**

- Added algebra to Euclidean geometry

Cartesian **geometry**

$$y = mx + c$$

- Added algebra to Euclidean geometry
 - ➔ Shapes could be expressed by equations

Cartesian geometry

$$y = mx + c$$

- Added algebra to Euclidean geometry
 - ➔ Shapes could be expressed by equations
 - ➔ Cartesian (or analytic) geometry

His name in Latin was
Renatus Cartesius

Cartesian geometry

$$y = mx + c$$

Descartes

After Frans Hals | Public domain, Wikimedia Commons

- Added algebra to Euclidean geometry
 - ➔ Shapes could be expressed by equations
 - ➔ Cartesian (or analytic) geometry

His name in Latin was
Renatus Cartesius

- Developed the coordinate system

2D coordinate frame

2D coordinate frame

- Two axes form a 2D coordinate frame

2D coordinate frame

- Two axes form a 2D **coordinate frame**

2D coordinate frame

- Two axes form a 2D **coordinate frame**

Points

Points

Points

$$P = (a, b)$$

Points

$$P = (a, b)$$

- A point is a location in n-dimensional space $P \in \mathbb{R}^n$

Points

- A point is a location in n-dimensional space $P \in \mathbb{R}^n$
- Represented by a Cartesian coordinate or an n-tuple $(x_1, x_2 \cdots x_n)$

Vectors

Vectors

Vectors

$$p = \begin{bmatrix} a \\ b \end{bmatrix}$$

Vectors

$$\mathbf{p} = \begin{bmatrix} a \\ b \end{bmatrix}$$

- A vector is an element of an n -dimensional vector space $\mathbf{p} \in \mathbb{R}^n$

Vectors

$$\mathbf{p} = \begin{bmatrix} a \\ b \end{bmatrix}$$

- A vector is an element of an n-dimensional vector space $\mathbf{p} \in \mathbb{R}^n$
- Represented by an n-element column vector $[x_1, x_2 \cdots x_n]^T$

Vectors

$$\mathbf{p} = \begin{bmatrix} a \\ b \end{bmatrix}$$

- A vector is an element of an n-dimensional vector space $\mathbf{p} \in \mathbb{R}^n$
- Represented by an n-element column vector $[x_1, x_2 \cdots x_n]^T$
- Can be considered a relative displacement

Vectors

$$\mathbf{p} = \begin{bmatrix} a \\ b \end{bmatrix}$$

- A vector is an element of an n -dimensional vector space $\mathbf{p} \in \mathbb{R}^n$
- Represented by an n -element column vector $[x_1, x_2 \cdots x_n]^T$
- Can be considered a relative displacement
- The vector has a particular starting point

Vectors

- A vector is an element of an n -dimensional vector space $\mathbf{p} \in \mathbb{R}^n$
- Represented by an n -element column vector $[x_1, x_2 \cdots x_n]^T$
- Can be considered a relative displacement
- The vector has a particular starting point

Vectors

$$p = \begin{bmatrix} a \\ b \end{bmatrix}$$

Vectors

$$p = \begin{bmatrix} a \\ b \end{bmatrix}$$

$$p = a\hat{x} + b\hat{y}$$

Points and vectors

- Points

- ➡ Define a location

- ➡ Cannot add or multiply points

Points and vectors

- Points

- ➔ Define a location
- ➔ Cannot add or multiply points

- Vectors

- ➔ *Do not* define a location
 - specify how to get from one location to another
- ➔ Can add & subtract vectors
- ➔ Can multiply a vector by a scalar

Points and vectors

- Points

- ➡ Define a location
- ➡ Cannot add or multiply points

- Vectors

- ➡ *Do not* define a location
 - specify how to get from one location to another
- ➡ Can add & subtract vectors
- ➡ Can multiply a vector by a scalar

- The difference between two points is a vector

Points and vectors

- Points

- ➔ Define a location
- ➔ Cannot add or multiply points

- Vectors

- ➔ *Do not* define a location
 - specify how to get from one location to another
- ➔ Can add & subtract vectors
- ➔ Can multiply a vector by a scalar

- The difference between two points is a vector

- A point is defined by a vector displacement from another point (typically the origin of a coordinate frame)

Points and vectors

- Points

- ➔ Define a location
- ➔ Cannot add or multiply points

- Vectors

- ➔ *Do not* define a location
 - specify how to get from one location to another
- ➔ Can add & subtract vectors
- ➔ Can multiply a vector by a scalar

- The difference between two points is a vector

- A point is defined by a vector displacement from another point (typically the origin of a coordinate frame)

- Both can be represented by n real numbers

Right-handed **coordinate frame**

Right-handed **coordinate frame**

Euclidean geometry **applies to planes**

Euclidean geometry **applies to planes**

- Euclid's geometry (postulate 5)
 - ➔ parallel lines never intersect

Euclidean geometry **applies to planes**

- Euclid's geometry (postulate 5)
 - ➔ parallel lines never intersect
- On the surface of our planet, parallel lines at the equator will intersect at the poles

Euclidean geometry **applies to planes**

- Euclid's geometry (postulate 5)
 - ➔ parallel lines never intersect
- On the surface of our planet, parallel lines at the equator will intersect at the poles
- Euclidean geometry does not apply
 - ➔ it is a non-Euclidean geometry

Euclidean geometry **applies to planes**

- Euclid's geometry (postulate 5)
 - ➔ parallel lines never intersect
- On the surface of our planet, parallel lines at the equator will intersect at the poles
- Euclidean geometry does not apply
 - ➔ it is a non-Euclidean geometry
- Euclidean geometry is a good approximation over small areas

Section2

Position and pose

Pose

- It has 3 parameters:

pronounced ksi

(x, y, θ)

Coordinate frame rotation convention

- Angles increase positively in the anti-clockwise direction

Coordinate frame rotation convention

- Angles increase positively in the anti-clockwise direction

Pose

- It has 3 parameters:
- Think of it as just a move (x, y) and a twist (θ)

(x, y, θ)

Summary

- A point is described by a vector with respect to a coordinate frame

Summary

- A point is described by a vector with respect to a coordinate frame

Summary

- A point is described by a vector with respect to a coordinate frame
- The pose of a coordinate frame can be described with respect to another coordinate frame

Summary

- A point is described by a vector with respect to a coordinate frame
- The pose of a coordinate frame can be described with respect to another coordinate frame

Summary

- A point is described by a vector with respect to a coordinate frame
- The pose of a coordinate frame can be described with respect to another coordinate frame
- Pose can be considered as the motion of a coordinate frame
 - ➔ a translation and a rotation

Section3 Relative positions

- We can't add **Poses** and **Vectors**
- They are different things

- We can't add **Poses** and **Vectors**
- They are different things

$${}^W p_d = {}^W \xi_C \cdot {}^C p_d$$

- We can't add **Poses** and **Vectors**
- They are different things

$${}^W p_d = {}^W \xi_C \cdot {}^C p_d$$

Section 4

Relative poses

Relative points

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

- Relative poses can be **compounded** or **composed**

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

- Relative poses can be **compounded** or **composed**

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

$${}^A \xi_C = {}^A \xi_B \oplus {}^B \xi_C$$

- Relative poses can be **compounded** or **composed**

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

$${}^A \xi_C = {}^A \xi_B \oplus {}^B \xi_C$$

composition

- Relative poses can be **compounded** or **composed**

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

$${}^A \xi_C = {}^A \xi_B \oplus {}^B \xi_C$$

$${}^A p = ({}^A \xi_B \oplus {}^B \xi_C) \cdot {}^C p$$

- Relative poses can be **compounded** or **composed**

Relative **points**

$${}^A p = {}^A \xi_B \cdot {}^B p$$

$${}^A \xi_C = {}^A \xi_B \oplus {}^B \xi_C$$

$${}^A p = ({}^A \xi_B \oplus {}^B \xi_C) \cdot {}^C p$$

- Relative poses can be **compounded** or **composed**
- We can extend this approach indefinitely...

$${}^A p = {}^A \mathbf{R}_B {}^B p \quad {}^A \mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

Consider **rotation first**

$${}^A p = \mathbf{R} {}^B p \quad \mathbf{R} = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

$${}^A p = {}^A \mathbf{R}_B {}^B p \quad {}^A \mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- **R** is a rotation matrix that:
 - rotates vectors from frame {B} to frame {A}

$${}^A \mathbf{R}_B$$

Properties of the **rotation matix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix
 - ➡ Each column is a unit length vector

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix
 - ➔ Each column is a unit length vector
 - ➔ Each column is orthogonal to all other columns

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix
 - ➔ Each column is a unit length vector
 - ➔ Each column is orthogonal to all other columns
- The inverse is the same as the transpose $\mathbf{R}^{-1} = \mathbf{R}^T$

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix
 - ➔ Each column is a unit length vector
 - ➔ Each column is orthogonal to all other columns
- The inverse is the same as the transpose $\mathbf{R}^{-1} = \mathbf{R}^T$
- The determinant is +1 $\det(\mathbf{R}) = 1$
 - ➔ the length of a vector is unchanged by rotation

Properties of the **rotation matrix**

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

- An orthogonal (orthonormal) matrix
 - ➔ Each column is a unit length vector
 - ➔ Each column is orthogonal to all other columns
- The inverse is the same as the transpose $\mathbf{R}^{-1} = \mathbf{R}^T$
- The determinant is +1 $\det(\mathbf{R}) = 1$
 - ➔ the length of a vector is unchanged by rotation

- Rotation matrices belong to the Special Orthogonal group of dimension 2 $\mathbf{R} \in SO(2)$

https://www.youtube.com/watch?v=KufsL2VgELo&list=PLts2VQxwm4syWiLA7P-_DREHdV3OyP14w&index=29

Inverse rotation

$${}^A\boldsymbol{p} = {}^A\mathbf{R}_B {}^B\boldsymbol{p}$$

Inverse rotation

$${}^A\boldsymbol{p} = {}^A\mathbf{R}_B {}^B\boldsymbol{p}$$

$${}^B\boldsymbol{p} = {}^A\mathbf{R}_B^{-1} {}^A\boldsymbol{p}$$

Inverse rotation

- To rotate a vector from frame {A} to frame {B} we use the inverse rotation matrix
 - ➡ The inverse is simply the transpose

$${}^A\mathbf{p} = {}^A\mathbf{R}_B {}^B\mathbf{p}$$

$${}^B\mathbf{p} = {}^A\mathbf{R}_B^{-1} {}^A\mathbf{p}$$

Inverse rotation

- To rotate a vector from frame {A} to frame {B} we use the inverse rotation matrix
 - ➡ The inverse is simply the transpose

$${}^A\mathbf{p} = {}^A\mathbf{R}_B {}^B\mathbf{p}$$

$${}^B\mathbf{p} = {}^A\mathbf{R}_B^{-1} {}^A\mathbf{p}$$

$${}^B\mathbf{p} = {}^B\mathbf{R}_A {}^A\mathbf{p}$$

Inverse rotation

- To rotate a vector from frame {A} to frame {B} we use the inverse rotation matrix
 - ➡ The inverse is simply the transpose

$${}^A p = {}^A \mathbf{R}_B {}^B p$$

$${}^B p = {}^A \mathbf{R}_B^{-1} {}^A p$$

$${}^B p = {}^B \mathbf{R}_A {}^A p$$

$${}^B \mathbf{R}_A = {}^A \mathbf{R}_B^{-1}$$

Table 2.1.
Summary of the various
concrete representations of
pose ξ introduced in this chapter

Representation	$\oplus$	$\ominus$	transl.	rotn.	dim	MATLAB
$(x, y, \theta) \in \mathbb{R}^2 \times \mathbb{S}$			✓	✓	2D	
$T \in SE(2)$	$T_1 T_2$	T^{-1}	✓	×	2D	<code>se2(x, y)</code>
$R \in SO(2)$	$R_1 R_2$	R^T	×	✓	2D	<code>se2(0, 0, th)</code>
$T \in SE(2)$	$T_1 T_2$	T^{-1}	✓	✓	2D	<code>se2(x, y, th)</code>
$(x, y, z, \Gamma) \in \mathbb{R}^3 \times \mathbb{S}^3$			✓	✓	3D	
$R \in SO(3)$	$R_1 R_2$	R^T	×	✓	3D	<code>rotx, roty, ...</code>
$\Gamma \in \mathbb{S}^3$	×			✓	3D	<code>tr2eul, eul2tr</code>
$\Gamma \in \mathbb{S}^3$	×			✓	3D	<code>tr2rpy1, rpy2tr</code>
$T \in SE(3)$	$T_1 T_2$	T^{-1}	✓	✓	3D	<code>transl(x, y, z)</code>
$\dot{q} \in \mathbb{Q}$	$\dot{q}_1 \dot{q}_2$	$\dot{q}^{-1}$	×	✓	3D	<code>quaternion</code>

Section8 Summary

Coordinate frames

- Coordinate frames are your friend
 - ➡ they describe the pose of objects in the world
 - ➡ use lots of them

Right-handed **coordinate frame**

Coordinate frame **rotation convention**

- Angles increase positively in the anti-clockwise direction

Points & vectors

- A point is described by a vector with respect to a coordinate frame

Pose

- The pose of one coordinate frame with respect to another is a relative pose
 - ➔ it has three parameters (x, y, θ)
 - ➔ we can consider it as a simple motion comprising translation and rotation

pronounced **ksi**

- We can't add **Poses** and **Vectors**
- They are different things

$${}^W p_d = {}^W \xi_C \cdot {}^C p_d$$

transform
vector from one frame
to another

Composition of **poses**

$${}^A \xi_C = {}^A \xi_B \oplus {}^B \xi_C$$

composition

- Relative poses can be **compounded** or **composed**
- We can extend this approach indefinitely...

Pose graphs

- We can express complex problems as pose graphs

$$w\xi_h = w\xi_c \oplus c\xi_r \oplus r\xi_h$$

$$h\xi_l = \ominus r\xi_h \ominus c\xi_r \oplus c\xi_l$$

Spatial algebra

- We can use a spatial algebra to solve for spatial relationships

$${}^X\xi_Y \oplus {}^Y\xi_Z = {}^X\xi_Z$$

$${}^Xp = {}^X\xi_Y \bullet {}^Yp$$

$$\xi_1 \oplus \xi_2 \neq \xi_2 \oplus \xi_1$$

$$\xi \ominus \xi = 0$$

$$\xi \oplus 0 = \xi$$

$$\ominus \xi \oplus \xi = 0$$

$$\ominus {}^X\xi_Y = {}^Y\xi_X$$

$$\xi \ominus 0 = \xi$$

Rotation matrix

- We can rotate a vector from one frame to another

$${}^A\mathbf{R}_B = \begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$$

$${}^B\mathbf{R}_A = {}^A\mathbf{R}_B^{-1}$$

- Rotates vectors from frame {B} to frame {A}
- Is a function of the rotation angle from frame {A} to frame {B}
- An orthogonal (orthonormal) matrix
 - ➡ The inverse is the same as the transpose $\mathbf{R}^{-1} = \mathbf{R}^T$
 - ➡ The determinant is +1
- Rotation matrices belong to the Special Orthogonal group of dimension 2 $\mathbf{R} \in SO(2)$

$${}^A\mathbf{R}_B$$

Homogeneous transformation

- In concrete terms we can represent pose by 3x3 homogeneous transformation matrix $\mathbf{T} \in SE(2)$

$${}^A\xi_B \sim {}^A\mathbf{T}_B = \begin{pmatrix} \cos \theta & -\sin \theta & t_x \\ \sin \theta & \cos \theta & t_y \\ 0 & 0 & 1 \end{pmatrix}$$

$${}^X\xi_Y \oplus {}^Y\xi_Z \mapsto {}^X\mathbf{T}_Y {}^Y\mathbf{T}_Z$$

$$\ominus \xi \mapsto \mathbf{T}^{-1}$$

$$\xi \cdot p \mapsto \mathbf{T}\tilde{p}$$

$${}^A\mathbf{T}_B \quad p = \begin{pmatrix} a \\ b \end{pmatrix} \quad \tilde{p} = \begin{pmatrix} a \\ b \\ 1 \end{pmatrix}$$
